

# 适用于汽车应用的 LM2904-Q1、LM2904B-Q1 业界通用双路运算放大器

## 1 特性

- 符合面向汽车应用的 AEC Q-100 标准
  - 温度等级 1: -40°C 至 +125°C
  - 器件 HBM ESD 分类等级 2
  - 器件 CDM ESD 分类等级 C5
- 宽电源电压范围为 3V 至 36V (LM2904B-Q1)
- 每通道电源电流 300μA (LM2904B-Q1, 典型值)
- 单位增益带宽为 1.2MHz (LM2904B-Q1)
- 共模输入电压范围包括接地, 支持近地直接检测
- 低输入失调电压在 25°C 时为 3mV (LM2904B-Q1, 最大值)
- 内部射频和 EMI 滤波器 (LM2904B-Q1)

## 2 应用

- 汽车照明
- 车身电子装置
- 汽车音响主机
- 远程信息处理控制单元
- 紧急呼叫 (eCall)
- 被动安全: 制动系统
- 电动汽车/混合动力电动汽车:
  - 逆变器和电机控制
  - 车载充电器 (OBC) 和无线充电器
  - 电池管理系统 (BMS)

## 3 说明

LM2904-Q1 和 LM2904B-Q1 是符合 AEC-Q100 规范的工业标准运算放大器, 适合汽车使用。LM2904B-Q1 是 LM2904-Q1 的下一代版本, 包含两个高电压 (36V) 运算放大器。LM2904B-Q1 为成本敏感性应用带来了出色的价值, 该器件的特性包括低失调电压 (1mV, 典型值)、接地共模输入范围以及高差分输入电压能力。

LM2904B-Q1 利用单位增益稳定性、更低的失调电压 (1mV, 典型值) 和更低的静态电流 (300μA, 典型值) 等增强型特性简化电路设计。高 ESD (2kV, HBM) 和集成 EMI 和射频滤波器可支持将 LM2904B-Q1 器件用于汽车市场中最严苛、最具环境挑战性的应用。

		MIN	MAX	UNIT	
Supply voltage, $V_S = ([V+] - [V-])$	LM2904B-Q1		40	V	
	LM2904V-Q1, LM2904AV-Q1		32		
	LM2904-Q1		26		
Differential input voltage, $V_{ID}$ <sup>(2)</sup>	LM2904B-Q1, LM2904V-Q1, LM2904AV-Q1	-32	32	V	
	LM2904-Q1	-26	26		
Input voltage, $V_I$	Either input	LM2904B-Q1	-0.3	40	V
		LM2904V-Q1, LM2904AV-Q1	-0.3	32	
		LM2904-Q1	-0.3	26	
Duration of output short circuit (one amplifier) to $V_-$ at (or below) $T_A = 25^\circ\text{C}$ , $V_S \leq 15\text{ V}$ <sup>(3)</sup>		Unlimited		s	
Operating ambient temperature, $T_A$		-40	125	$^\circ\text{C}$	
Operating virtual-junction temperature, $T_J$			150	$^\circ\text{C}$	
Storage temperature, $T_{stg}$		-65	150	$^\circ\text{C}$	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Differential voltages are at  $IN+$ , with respect to  $IN-$ .
- (3) Short circuits from outputs to the supply pins can cause excessive heating and eventual destruction.

### 7.2 ESD Ratings

		VALUE	UNIT
<b>LM2904B-Q1</b>			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	$\pm 2000$	V
	Charged-device model (CDM), per AEC Q100-011	$\pm 750$	
<b>LM2904-Q1, LM2904AV-Q1, AND LM2904V-Q1</b>			
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup>	$\pm 1000$	V
	Charged-device model (CDM), per AEC Q100-011	$\pm 500$	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 7.3 Recommended Operating Conditions

## 9 Detailed Description

### 9.1 Overview

The LM2904-Q1 and LM2904B-Q1 devices consist of two independent, high-gain frequency-compensated operational amplifiers designed to operate from a single supply over a wide range of voltages. Operation from split supplies also is possible if the difference between the two supplies is within the supply voltage range specified in the *Recommended Operating Conditions* section, and  $V_S$  is at least 1.5 V more positive than the input common-mode voltage. The low supply-current drain is independent of the magnitude of the supply voltage.

Applications include transducer amplifiers, dc amplification blocks, and all the conventional operational amplifier circuits that now can be implemented more easily in single-supply-voltage systems. For example, these devices can be operated directly from the standard 5-V supply used in digital systems and easily can provide the required interface electronics without additional  $\pm 5$ -V supplies.

### 9.2 Functional Block Diagram

## 9.3 Feature Description

### 9.3.1 Unity-Gain Bandwidth

The unity-gain bandwidth is the frequency up to which an amplifier with a unity gain may be operated without greatly distorting the signal. These devices have a 1.2-MHz unity-gain bandwidth (LM2904B-Q1).

### 9.3.2 Slew Rate

The slew rate is the rate at which an operational amplifier can change its output when there is a change on the input. These devices have a 0.5-V/ $\mu$ s slew rate (LM2904B-Q1).

### 9.3.3 Input Common Mode Range

The valid common mode range is from device ground to  $V_S - 1.5$  V ( $V_S - 2$  V across temperature). Inputs may exceed  $V_S$  up to the maximum  $V_S$  without device damage. At least one input must be in the valid input common-mode range for the output to be the correct phase. If both inputs exceed the valid range, then the output phase is undefined. If either input more than 0.3 V below  $V_-$  then input current should be limited to 1 mA and the output phase is undefined.

## 9.4 Device Functional Modes

The LM2904-Q1 and LM2904B-Q1 devices are powered on when the supply is connected. This device can be operated as a single-supply operational amplifier or dual-supply amplifier, depending on the application.

## 10 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

The LM2904-Q1 and LM2904B-Q1 operational amplifiers are useful in a wide range of signal conditioning applications. Inputs can be powered before  $V_S$  for flexibility in multiple supply circuits. For full application design guidelines related to this family of devices, please refer to the application report [Application design guidelines for LM324/LM358 devices](#).

### 10.2 Typical Application

A typical application for an operational amplifier is an inverting amplifier. This amplifier takes a positive voltage on the input, and makes it a negative voltage of the same magnitude. In the same manner, it also makes negative voltages positive.

图 42. Application Schematic

#### 10.2.1 Design Requirements

The supply voltage must be chosen such that it is larger than the input voltage range and output range. For instance, this application scales a signal of  $\pm 0.5$  V to  $\pm 1.8$  V. Setting the supply at  $\pm 12$  V is sufficient to accommodate this application.

#### 10.2.2 Detailed Design Procedure

Determine the gain required by the inverting amplifier using [公式 1](#) and [公式 2](#):

$$A_V = \frac{V_{OUT}}{V_{IN}} \quad (1)$$

$$A_V = \frac{1.8}{-0.5} = -3.6 \quad (2)$$

Once the desired gain is determined, choose a value for  $R_I$  or  $R_F$ . Choosing a value in the kilohm range is desirable because the amplifier circuit uses currents in the milliamperere range. This ensures the part does not draw too much current. This example uses 10 k $\Omega$  for  $R_I$  which means 36 k $\Omega$  is used for  $R_F$ . This was determined by [公式 3](#).

$$A_V = -\frac{R_F}{R_I} \quad (3)$$

## 11 Power Supply Recommendations

### CAUTION

Supply voltages larger than specified in the recommended operating region can permanently damage the device (see the [Absolute Maximum Ratings](#)).

Place 0.1- $\mu$ F bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the [Layout](#) section.

## 12 Layout

### 12.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole, as well as the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep them separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping R<sub>F</sub> and R<sub>G</sub> close to the inverting input minimizes parasitic capacitance, as shown in the [Layout Examples](#) section.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
